16. ABSTRACT  This industry study is one of a series under the Office of Solid Waste Management Program of the Hazardous Waste Management Division, U.S. Environmental Protection Agency. The report concentrates on the rubber and plastics industry. It characterizes these industries in terms of number, location, size and age of plants, products, processes, etc.; identifies and quantifies those wastes which are or may be generated by these industries; describes current practices for treatment and disposal of potentially hazardous wastes; determines the control technologies which might be applied to reduce hazards presented by these wastes upon disposal; and estimates the cost of control technology implementations.  The information presented in the report was acquired from a review of published information; trade association participation; personal contacts; visits to various plants and corporate offices of germane companies; waste sample analysis; and the application of an econometric model to project waste loads for 1977 and 1983.

### APPENDICES

<u>Appendix</u>	<u>Title</u>
A	Program Methodology
B	Protocols Used And Results Obtained In Analysis Of Waste Stream Samples
C	Hazardous Waste Contractors And Service Organizations
D	Detailed Definition Of The Plastics And Rubber Industry -- SICs 282 and 30

## APPENDIX A -- PROGRAM METHODOLOGY

The approach selected to assess industrial hazardous waste practices in the rubber and plastics industry centered around three major tasks:

- . Data collection
- . Data analysis and application of economic modeling techniques
- . Definition of potentially hazardous waste.

Each of these elements are discussed below. Overall study logic is provided in Exhibit A-1, at the end of the appendix, followed by a task definition in Exhibit A-2.

### 1. DATA COLLECTION

As noted in Volume I -- Executive Summary, the data requirements for this study were obtained essentially from four sources.

- . Review of published information
- . Data collected during our previous work for government agencies on the rubber and plastics industry
- . Information obtained from trade association participation
- . Information obtained from personal contact and visits to the various plants and corporate offices of companies classified in the industry and to waste disposal firms handling hazardous wastes.

Of the above information sources, direct industry contacts proved to be most useful in providing the detailed data requirements. Because almost all facilities visited varied significantly in the manner in which wastes were generated and disposed of, the same questions could not be asked of all the individuals contacted. Instead, questions were tailored for each situation.

However, as a guide to the types of questions and probes used to collect data, a data acquisition form is provided as Exhibit A-3, following Exhibit A-2.

As can be seen from Exhibit A-3, industry representatives were generally asked questions regarding:

- . Plant type, size, locations, etc.
- . Processing methods
- . Waste stream generation
- . Waste properties
- . Treatment and disposal methods
- . Costs for treatment and disposal of potentially hazardous wastes.

In addition, the representatives were asked if they would supply the Study Team with waste samples for analysis in our laboratories. The results of the sampling program are described in Appendix B and in the body of the report.

Exhibit A-4, following Exhibit A-3, tabulates significant production processes used in SICs 282 (Plastic Materials and Synthetic Industry) and SIC 30 (Rubber Production Industry). As presented by the exhibit, there are approximately 100 commercially significant processes. During the data collection phase of this study, more than 60 field trips were made. A field trip is defined as a visit to a plant site. However, in many cases, visits were actually made to a plant complex using more than one major process. Therefore, processes observed significantly exceeded field trips completed and provided coverage of most relevant processes in use at the time of the study. Exhibit A-5, following Exhibit A-4, provides a breakdown of contacts by groups visited. In addition, to the field trips, between 200 and 250 telephone calls were made to industry representatives to supplement data.

Exhibit A-6, following Exhibit A-5, provides the distribution of waste samples obtained and analyzed. Note that the purpose of the spot sampling program was to provide evidence of the reliability of assumptions made concerning the general composition of the wastes and the concentrations of related components.

## 2. DATA ANALYSIS

Data analysis generally involved:

- . Definition of processes used to manufacture materials
- . Estimate of waste streams and wastes generated from each unit operation by waste type and quantity
- . Classification of wastes into non-hazardous and potentially hazardous categories
- . Determination of waste disposal methods, their adequacy and their costs
- . Estimating the quantity of potentially hazardous wastes to be disposed of by state and EPA regions and nationwide for the year 1974, 1977 and 1983.

Estimates of potentially hazardous wastes to be disposed of on a geographic basis were made by:

- . Developing hazardous waste factors (as the weight of hazardous waste per weight of product produced) for a typical process type in a representative plant.
- . Multiplying these factors by the volume of production in a given geographic area.
- . Adding wastes produced by geographic area to arrive at national numbers.

Current production values and plant location were obtained from data, industry-supplied information, other published literature and professional judgments.

To obtain projections of potentially hazardous wastes to be disposed of in the years 1977 and 1983 industry production was estimated through a computer-based economics model, known as INFORUM -- Interindustry Economic Research Project of the University of Maryland.

The INFORUM model uses input-output (I/O) analysis to make long-term forecasts of the American economy. I/O analysis is based on the concept that the outputs on production of one industry can be translated into inputs or consumption in other industries. The model uses 200 industry groupings or sections to cover the entire economy.

The modeling process involves an estimation of consumption, investment, employment and export and import functions for each sector, using various alternative scenario assumptions about government expenditures, cost of capital, import/export restrictions and various technological developments. The forecasts proceed year-by-year for a decade into the future.

The value of wastes is estimated from the projected value (deflated to constant dollars) of material consumption and final production in each industry for selected years and from the waste generation factors calculated for typical processes. Based on an analysis of projected versus actual production and consumption as actual data becomes available, it is known that the INFORUM model provides a reasonably accurate means for estimating economic conditions.

### 3. DEFINITION OF POTENTIALLY HAZARDOUS WASTES

Under the time and budgetary constraints of the project, it was, of course, impossible to carry out detailed original toxicological, chemical, biological and other investigations to determine the potential hazard from the literally thousands of chemical substances in these industries which may become wastes. Instead, we relied on several published sources which are compendia of much of the required information. These sources are:

- . Reference 1 -- Dangerous Properties of Industrial Materials (4th Ed.) N. Irving Sax, Van Nostrand New York: Reinhold Company, 1974.
- . Reference 2 -- Clinical Toxicology of Commercial Properties (3rd Ed.) Gleason, Gosselin, Hodge and Smith, Baltimore: The Williams & Wilkins Co., 1969.
- . Reference 3 -- A Study of Hazardous Waste Materials, Hazardous Effects and Disposal Methods, Booz, Allen Research, Inc., United States Environmental Protection Agency (Contract #68-03-0032), Cincinnati, Ohio: 1972.

The following paragraphs detail the parameters which were used in determining if a waste as defined in the study may be potentially hazardous.

#### 3.1 Toxic Substances Were Defined On The Basis Of Oral Toxicity

The following toxic effects may occur in an acute form or chronic form or both, and may jeopardize the health and welfare of humans and the safety and propagation of terrestrial or aquatic life forms:

- . Oral toxicity
- . Inhalation toxicity
- . Dermal penetration toxicity
- . Dermal irritation reaction
- . Aquatic toxicity
- . Phytotoxicity.

For the purpose of this study, oral toxicity was accepted as the basis for defining a toxic substance because much more data is generally available to support published conclusions based on this parameter.

References 1 and 2 above were chosen as the primary sources determining if the wastes contain toxic materials. Two works were chosen for use because many substances needed to be categorized.

The most serious deficiency of the literature for the purposes of the project is that it is nearly all occupationally or laboratory oriented. The result is that toxic effects documented are responses to higher concentrations than levels which may be expected to accrue from deposition of relatively small quantities of these substances in landfill. Since few epidemiological facts are available, information developed on the basis of occupational or laboratory exposure was substituted.

The two references selected as our primary toxicological data base use different scales for rating a substance's toxicity:

- . Exhibit A-7, following Exhibit A-6, presents the toxicity rating scale for Reference 1.
- . Exhibit A-8, following Exhibit A-7, presents the scale for Reference 2.

In the determination of a waste constituents' toxicity, a conservative approach was chosen, since information contained in the reference may be based on more unknown factors than known ones. Therefore, any substance having a toxicity rating 2 (moderate) or above including U (unknown) in Reference 1; and 3 (moderate) and above, in Reference 2, was considered toxic in the context of this study. Wastes containing such substances in either the pure form or combined with other materials were considered potentially hazardous.

### 3.2 The Potential For Flammability, Explosivity And Reactivity/Corrosivity Of The Wastes Was Ranked

Human health and welfare, as well as animal and vegetation, may be exposed to hazardous situations involving flames and/or explosions caused by some substances. Other adverse effects may occur as a result of rapid or violent chemical reactions of substances. Flame, explosion or reactions produce heat which causes many compounds to emit highly toxic fumes or to react more vigorously with oxidizing materials. Some compounds can react rapidly with ground water, for example, to produce toxic or flammable vapors. Acids may be produced by reactions, and heat generated by flame or reaction may itself be a serious hazard to many ecosystems.

Just as there are levels of toxicity, there are degrees of flammability, explosivity and reactivity. To judge the potential hazard of the wastes in terms of these factors, we relied heavily on Reference 3 where many substances have been ranked as to their potential hazard capacity in this area.

In addition, information contained in the other two references was taken into account. Also, any waste substance with a flash point of 38°C (100°F) or higher (as measured by the Tag Open Tester), where known, were deemed potentially hazardous. This is the limit which has been made by the Department of Transportation to designate hazardous flammable solvents which require a red warning level.

The hazards rating criteria for flame explosion and reaction/corrosion in soil from Reference 3 is presented in Exhibit A-9, following Exhibit A-8. Any waste containing substances having a rating above 2 (moderate hazard) including U (unknown) was considered to be potentially hazardous.

If any constituent of a waste stream met the criteria described above as hazardous for any of the categories, the waste was considered potentially hazardous. Spot sampling of the waste (described in Appendix B) was used to confirm assumption on the presence of potentially hazardous components in the wastes.

# EXHIBIT A-1 STUDY LOGIC

## I. ANALYSES TO BE PERFORMED → II. WASTE DISPOSAL PRACTICE → III. DESIRED OUTPUTS

### RUBBER AND PLASTICS INDUSTRIES

#### INDUSTRY CHARACTERIZATION: TASK 1

Wastes Destined For Land Disposal<sup>(1)</sup> (2)

- Wastes whose physical properties are typified by
  - solid
  - liquid
  - sludge phases
- Wastes directly generated from manufacturing processes
- Wastes produced by air or water pollution control procedures

#### WASTE CHARACTERIZATION AND SCREENING: TASK 2

#### TREATMENT AND DISPOSAL TECHNOLOGY CHARACTERIZATION: TASK 3

#### COST ANALYSIS OF DISPOSAL TECHNOLOGY: TASK 4

Notes: (1) Wastes destined for release to air or water at plant site are viewed to be outside the scope of this study.

(2) Includes industry waste quantification on state and national levels. (wet and dry basis)

Source: Snell review and analysis of study requirements.

#### INDUSTRY DESCRIPTION

- Plants and locations
- Distribution of number of firms and plants
- Distribution of plant size as a function of employees
- Manufacturing process distribution
- Location distribution
- Age distribution
- Product line

#### METHODS OF WASTE TREATMENT AND DISPOSAL

- Detailed waste description and disposal methodology
- Process changes necessitated by reduction in hazardous waste production
- Levels of proficiency for disposal based on survey
  - .. Level I - techniques presently employed
  - .. Level II - best technology currently employed
  - .. Level III - technology necessary to provide adequate health and environmental protection = developing technology beyond Level II

#### COSTS OF ADEQUATE DISPOSAL

- Investment costs
- Operating costs

# EXHIBIT A-2

## TASK DEFINITION

<u>Task</u>	<u>Description</u>
1.	Industry Characterization
2.	Waste Characterization and Screening
2.1	. Develop material balance around each 4 digit SIC sector and engineering material balances for the individual processes of commercial significance ~100
2.2	. Develop hazardous materials priority list by process based on the substances identified in 2.1 and review with Project Officer
2.3	. Rank processes for potential for production of wastes destined for land disposal
2.4	. Develop priority decision model to screen out 20 processes (for budget purposes) for detailed studies in Tasks 3 and 4; <ul style="list-style-type: none"> <li>- Use the following parameters               <ul style="list-style-type: none"> <li>.. Hazard potential related to materials consumed based on Task 2.2</li> <li>.. Process potential for producing wastes destined for land disposal, based on Task 2.3</li> <li>.. Prevalence, based on Task 1, related to output, number of plants and average size</li> </ul> </li> <li>- Assign scores to these parameters and aggregate with hazard potential given highest weight</li> <li>- The higher the aggregate score, the higher the priority</li> <li>- The 20 processes with the highest scores will be studied in depth after the Project Officer's approval</li> </ul>
2.5	. Develop detailed engineering material balances and definition of practices around the 20 processes to be studied further and characterize wastes using sampling and analysis where required
3.	Treatment and Disposal Technology Characterization for the 20 Priority Processes from Task 2
4.	Cost Analysis of Disposal Technology for the 20 Priority Processes from Task 2

DATA ACQUISITION FORM

For

EPA Contract No. 68-01-3194

Assessment Of Industrial Hazardous Waste Practices  
In The Rubber And Plastics Industry

Foster D. Snell, Inc. is conducting this survey to provide data base regarding:

What process industrial wastes are generated (industrial waste is defined as any waste other than direct emissions to air or water effluents, where air and water treatment residues and other solids or liquids destined for land disposal are included).

In what quantities and from what specific process steps are these wastes generated.

How they are treated and disposed of.

Points of contacts in responding to the attached data acquisition inquiry are:

Mr. Joel M. Kushnir, Survey Coordinator or  
Mr. Stephen F. Nagy, Research Director

EXHIBIT A-7  
TOXIC HAZARD RATING SCALE FOR  
REFERENCE 1

<u>Toxicity Rating</u>	<u>Definition</u>
0	NONE: (a) No harm under any conditions (b) Harmful only under unusual conditions or overwhelming dosage.
1	SLIGHT: Causes readily reversible changes which disappear after end of exposure.
2	MODERATE: May involve both irreversible and reversible changes not severe enough to cause death or permanent injury.
3	HIGH: May cause death or permanent injury after very short exposure to small quantities.
U	UNKNOWN: No information on humans considered valid by authors.

Source: Dangerous Properties of Industrial Materials, 4th Ed.  
N. Irving Sax, Van Nostrand Reinhold Company,  
New York, 1974.

EXHIBIT A-8  
TOXIC HAZARD RATING SCALE FOR  
REFERENCE 2

<u>Toxicity Rating</u>	<u>Definition</u>	<u>Probable Lethal Dose (Human)</u>	
		<u>Mg/Kg</u>	<u>For 70 Kg Man (150 lbs)</u>
1	Practically non-toxic	above 15 gm/Kg	more than 1 quart
2	Slightly toxic	5 - 15	between 1 pint and 1 quart
3	Moderately toxic	500 - 5	between 1 ounce and 1 pint (or 1 lb.)
4	Very toxic	50 - 500	between 1 teaspoonful and one ounce
5	Extremely toxic	5 - 50	between 7 drops and 1 teaspoonful
6	Super toxic	less than 5	a taste (less than 7 drops)

Gleason, Gosselin, Hodge and Smith, The Williams &  
Wilkins Co., Baltimore, 1969.

EXHIBIT A-9  
FLAME, EXPLOSION AND REACTION/  
CORROSION HAZARD RATING SCALE  
FOR REFERENCE 3 (In Soil)

<u>FER/C Rating</u>	<u>Definition</u>
1	MINIMAL: Generally stable substances. Very limited potential for reaction or combustion. No toxic fumes or vapors associated with any reactions or combustions that may occur.
2	MODERATE: Can readily undergo violent chemical change with rapid release of energy, but will not detonate explosively or react violently except under very special circumstances such as heating under confinement. Can ignite and burn rapidly or react to produce harmful, though not lethal, vapors and fumes if exposed to modest increase of temperature or if moisture is encountered.
3	SEVERE: Readily capable of detonation and explosive decomposition or reaction at normal ambient temperatures and pressures. Will detonate as result of mechanical shock or local thermal shock. Reacts readily with own oxides or with other oxidizing materials. Can ignite spontaneously and/or react violently if exposed to moisture in soil. Ignition or reaction can produce lethal vapors, fumes, etc.
U	Unknown

FER/C = Flame, Explosion and Reaction/Corrosion

## APPENDIX B -- PROTOCOLS USED AND RESULTS OBTAINED IN ANALYSIS OF WASTE STREAM SAMPLES

This appendix presents the protocols used and the results obtained in the analysis of waste stream samples generated by the rubber and plastics industry. Spot samples were taken under the supervision of Snell personnel at the points of generation of the wastes.

### 1. ANALYTICAL PROTOCOLS

The detailed protocols are presented in the following paragraphs with reference to standard tests where warranted.

#### (1) Total Solids

The test was performed in accordance with the "Standard Methods For the Examination of Water and Waste Water", APHA, 13th Edition, 1971, pp. 288-290.

#### (2) Water Content

By Toluene Distillation Method -- adopted from "Official Methods of Analysis of the Association of Official Analytical Chemists", 12th Edition, 1975, p. 129.

#### (3) Ash Residue

The sample is weighed into a porcelain crucible and ashed on a Meeker Burner at 600°C. After ashing, the residual weight is determined and the percent ash calculated. The residue is used for emission spectroscopy semi-quantitative determination.

#### (4) Emission Spectroscopy

A known amount of the ashed material is intimately mixed with 100 mg. of carbon powder followed by addition of 3 ml. of aqua regia. All of the material is evaporated to dryness and gently ignited. The resulting mixture is transferred to an electrode and D.C. arced to completion. A series of standards in a carbon matrix are run along with the sample and semi-quantitative results are obtained for each element employing a Jarrel-Ash Model 3.4 Meter Ebert Emission Spectrograph. The results are then calculated from known standards and are expressed in semi-quantitative manner.

(5) Atomic Absorption Spectroscopy

The samples are digested with nitric acid, filtered and the filtrate diluted with water. The resulting solution is then aspirated into the flame of an atomic absorption spectrophotometer. Known standards are used for calibration of the instrument and for quantitative determination of the element in question.

(6) Organic Chlorides

The Parr Bomb Oxygen Combustion method followed by microcoulometry is employed for the determination of organic chlorides.

(7) Phenols

The determinations are performed in accordance with Method D. for phenols in "Standard Methods for the Examination of Water and Waste Water", APHA, 13th Edition, 1971, pp. 507-508.

(8) Vinyl Chloride Monomer (VCM)

There is no official method for this determination and recently possible interferences from acetaldehyde, resulting from copolymerization of VCM and vinyl acetate, has been reported. The protocol used by Foster D. Snell is as follows:

Solid Samples -- A representative portion of the sample is ground to a fine powder. Two grams of this powder is digested for 6 hours with 40 ml of tetrahydrofuran (THF). The digestion product is centrifuged and the supernatant subjected to gas chromatographic analysis under the following conditions: The gas chromatograph is a Perkin-Elmer 900. The column is 8' x 1/8" O.D. packed with 20% DC 550. The carrier gas is nitrogen flowing at 30 ml/min. The column is operated at 60°C until emergence of THF. The temperature is then raised to 150°C and held for 10 minutes, and then lowered slowly.

Calculations -- A standard is prepared containing  $0.5 \times 10^{-9}$  micrograms of vinyl chloride monomer in THF. A 5  $\mu$ l injection at an attenuation factor of 1 x 4 gives a peak height of 120 mm with a retention time of 0.75 minutes.

The peak height of the extracts, corrected for the appropriate attenuation factor, is used to determine the sample concentration.

## 2. ANALYTICAL RESULTS

The analytical results for the waste samples obtained from the plant visits and tested by Foster D. Snell, Inc. are presented in the attached Tables.

TABLE B-1 -- Tests performed on waste samples obtained from plants in SIC 282, Plastic Materials and Synthetics Industry.

TABLE B-2 -- Tests performed on waste samples obtained from plants in SIC 30, Rubber Products Industry.

TABLE B-1

ANALYTICAL RESULTS OF WASTE SAMPLES  
OBTAINED IN SIC 282, PLASTIC MATERIALS  
AND SYNTHETICS INDUSTRY

Product	Waste Description	Ash %	Ion Content <sup>(1)</sup>														Organic Cl	Other

Appendix D.     DETAILED DEFINITION OF THE PLASTICS AND RUBBER  
INDUSTRY -- SICs 282 AND 30

Exhibits D-1 through D-9 present a detailed definition for each of the industry segments of SIC 282 and SIC 30.

**SIC 2821 PLASTICS MATERIALS, SYNTHETIC RESINS, AND NONVULCANIZABLE ELASTOMERS**

Establishments primarily engaged in manufacturing synthetic resins, plastics materials, and nonvulcanizable elastomers. Important products of this industry include: cellulose plastic materials; phenolic and other tar acid resins; urea and melamine resins; vinyl resins; styrene resins; alkyd resins; acrylic resins; polyethylene resins; polypropylene resins; rosin modified resins; coumarone-indene and petroleum polymer resins; and miscellaneous resins including polyamide resins, silicones, polyisobutylenes, polyesters, polycarbonate resins, acetal resins, fluorohydrocarbon resins; and casein plastics. Establishments primarily engaged in manufacturing fabricated plastics products or plastics film, sheet, rod, nontextile monofilaments and regenerated cellulose products, and vulcanized fiber are classified in Industry 3079, whether from purchased resins or from resins produced in the same plant. Establishments primarily engaged in compounding purchased resins are also classified in Industry 3079. Establishments primarily manufacturing adhesives are classified in Industry 2891.

Acetal resins	Ester gum
Acetate, cellulose (plastics)	Ethyl cellulose plastics
Acrylic resins	Ethylene-vinyl acetate resins
Acrylonitrile-butadiene-styrene resins	Fluorohydrocarbon resins
Alcohol resins, polyvinyl	Ion exchange resins
Alkyd resins	Ionomer resins
Allyl resins	Isobutylene polymers
Butadiene copolymers, containing less than 50% butadiene	Lignin plastics
Carbohydrate plastics	Melamine resins
Casein plastics	Methyl acrylate resins
Cellulose nitrate resins	Methyl cellulose plastics
Cellulose propionate (plastics)	Methyl methacrylate resins
Coal tar resins	Molding compounds, plastics
Condensation plastics	Nitrocellulose plastics (pyroxylin)
Coumarone-indene resins	Nylon resins
Cresol-furfural resins	Petroleum polymer resins
Cresol resins	Phenol-furfural resins
Dicyandiamine resins	Phenolic resins
Diisocyanate resins	Phenoxy resins
Elastomers, nonvulcanizable (plastics)	Phthalic alkyd resins
Epichlorohydrin bisphenol	Phthalic anhydride resins
Epichlorohydrin diphenol	Polyacrylonitrile resins
Epoxy resins	Polyamide resins
	Polycarbonate resins

EXHIBIT D-1(2)

Polyesters  
Polyethylene resins  
Polyhexamethylenediamine adipamide resins  
Polyisobutylenes  
Polymerization plastics, except fibers  
Polypropylene resins  
Polystyrene resins  
Polyurethane resins  
Polyvinyl chloride resins  
Polyvinyl halide resins  
Polyvinyl resins  
Protein plastics  
Pyroxylin  
Resins, phenolic  
Resins, synthetic: coal tar and non-coal tar  
Rosin modified resins  
Silicone fluid solution (fluid for sonar transducers)  
Silicone resins  
Soybean plastics  
Styrene resins  
Styrene-acrylonitrile resins  
Tar acid resins  
Urea resins  
Vinyl resins

Source: 1972 Standard Industrial Classification Manual

**SIC 2822 SYNTHETIC RUBBER (VULCANIZABLE ELASTOMERS)**

Establishments primarily engaged in manufacturing synthetic rubber by polymerization or copolymerization. An elastomer for the purpose of this classification is a rubber-like material capable of vulcanization, such as copolymers of butadiene and styrene, or butadiene and acrylonitrile, polybutadienes, chloroprene rubbers, and isobutylene-isoprene copolymers. Butadiene copolymers containing less than 50% butadiene are classified in Industry 2821. Natural chlorinated rubbers and cyclized rubbers are considered as semifinished products and are classified in Industry 3069.

Acrylate type rubbers	Isoprene rubbers, synthetic
Acrylate-butadiene rubbers	Neoprene
Acrylic rubbers	Nitrile-butadiene rubbers
Adiprene	Nitrile-chloroprene rubbers
Butadiene-acrylonitrile copolymers (over 50% butadiene)	Nitrile type rubber
Butadiene rubbers	N-type rubber
Butadiene-styrene copolymers (over 50% butadiene)	Polybutadienes
Butyl rubber	Polyethylenes, chlorosulfonated
Chlorinated rubbers, synthetic	Polyisobutylene-isoprene elastomers
Chloroprene type rubbers	Polyisobutylene (synthetic rubber)
Chlorosulfonated polyethylenes	Polymethylene rubbers
Cyclo rubbers, synthetic	Polysulfides
EPDM polymers	Pyridine-butadiene copolymers
Elastomers, vulcanizable (synthetic rubber)	Pyridine-butadiene rubbers
Epichlorohydrin elastomers	Rubber synthetic
Estane	Silicone rubbers
Ethylene-propylene rubbers	S-type rubber
Fluoro rubbers	Stereo regular elastomers
Fluorocarbon derivative rubbers	Styrene-butadiene rubbers (50% or less styrene content)
Hypalon	Styrene-chloroprene rubbers
Isobutylene-isoprene rubbers	Styrene-isoprene rubbers
Isocyanate type rubber	Thiol rubbers
	Urethane rubbers
	Vulcanized oils

Source: 1972 Standard Industrial Classification Manual

**SIC 2823 CELLULOSIC MAN-MADE FIBERS**

Establishments primarily engaged in manufacturing cellulosic fibers (including cellulose acetate and regenerated cellulose such as rayon by the viscose or cuprammonium process) in the form of monofilament, yarn, staple or tow suitable for further manufacturing on spindles, looms, knitting machines or other textile processing equipment. Establishments primarily engaged in manufacturing textile glass fibers are classified in Industry 3229.

Acetate fibers  
Cellulose acetate monofilament, yarn,  
staple, or tow  
Cellulose fibers, man-made  
Cigarette tow, cellulosic fiber  
Cuprammonium fibers  
Fibers, cellulose man-made  
Fibers, rayon  
Horsehair, artificial; rayon  
Nitrocellulose fibers

Rayon primary products: fibers, straw,  
strips, and yarn  
Rayon yar, made in chemical plants  
(primary products)  
Regenerated cellulose fibers  
Triacetate fibers  
Viscose fibers, bands, strips, and yarn  
Yarn, cellulosic: made in chemical  
plants (primary products)

Source: 1972 Standard Industrial Classification Manual

EXHIBIT D-4  
DEFINITION OF SIC 2824

**SIC 2824 SYNTHETIC ORGANIC FIBERS, EXCEPT CELLULOSIC**

Establishments primarily engaged in manufacturing synthetic organic fibers, except cellulosic (including those of regenerated proteins, and of polymers or copolymers of such components as vinyl chloride, vinylidene chloride, linear esters, vinyl alcohols, acrylonitrile, ethylenes, amides, and related polymeric materials) in the form of monofilament, yarn, staple or tow suitable for further manufacturing on spindles, looms, knitting machines or other textile processing equipment. Establishments primarily engaged in manufacturing textile glass fibers are classified in Industry 3229.

Acrylic fibers  
Acrylonitrile fibers  
Anidex fibers  
Casein fibers  
Elastomeric fibers  
Fibers, man-made: except cellulosic  
Fluorocarbon fibers  
Horsehair, artificial: nylon  
Linear esters fibers  
Modacrylic fibers  
Nylon fibers and bristles  
Olefin fibers  
Organic fibers, synthetic: except  
cellulosic

Polyester fibers  
Polyvinyl ester fibers  
Polyvinylidene chloride fibers  
Protein fibers  
Saran fibers  
Soybean fibers ( man-made textile  
materials)  
Vinyl fibers  
Vinylidene chloride fibers  
Yarn, organic man-made fiber  
except cellulosic  
Zein fibers

Source: The 1972 Standard Industrial Classification Manual.

EXHIBIT D-5  
DEFINITION OF SIC 3011

SIC 3011 TIRES AND INNER TUBES

Establishments primarily engaged in manufacturing pneumatic casings, inner tubes, and solid and cushion tires for all types of vehicles, airplanes, farm equipment, and children's vehicles; tiring; and camelback, and tire repair and retreading materials. Establishments primarily engaged in retreading tires are classified in Industry 7534.

Camelback for tire retreading  
Inner tubes; airplane, automobile,  
bicycle, motorcycle, and tractor  
Pneumatic casings (rubber tires)  
Tire sundries and tire repair materials,  
rubber

Tires, cushion or solid rubber  
Tiring, continuous lengths: rubber,  
with or without metal core

Source: 1972 Standard Industrial Classification Manual

EXHIBIT D-6  
DEFINITION OF SIC 3021

SIC 3021 RUBBER AND PLASTICS FOOTWEAR

Establishments primarily engaged in manufacturing all rubber and plastics footwear, waterproof fabric upper footwear, and other fabric upper footwear having rubber or plastic soles vulcanized to the uppers. Establishments primarily engaged in manufacturing rubber, composition, and fiber heels, soles, soling strips, and related shoemaking and repairing materials are classified in Industry 3069; plastic soles and soling strips in Industry 3079.

Arctics, rubber or rubber soled fabric  
Boots, plastics  
Boots, rubber or rubber soled fabric  
Canvas shoes, rubber soled  
Footholds, rubber  
Footwear, rubber or rubber soled fabric  
Gaiters, rubber or rubber soled fabric  
Galoshes, plastics  
Galoshes, rubber or rubber soled fabric  
Overshoes, plastics

Overshoes, rubber or rubber soled fabric  
Pacs, rubber or rubber soled fabric  
Sandals, rubber  
Shoes, plastics soles molded to fabric uppers  
Shoes, rubber or rubber soled fabric uppers  
Shower sandals or slippers, rubber

Source: 1972 Standard Industrial Classification Manual

EXHIBIT D-7  
DEFINITION OF THE RECLAIMED  
RUBBER INDUSTRY SIC 3031

**SIC 3031 RECLAIMED RUBBER**

Establishments primarily engaged in reclaiming rubber from scrap rubber tires, tubes, and miscellaneous waste rubber articles by processes which result in devulcanized, depolymerized or regenerated replasticized products containing added ingredients. These products are sold for use as a raw material in the manufacture of rubber goods with or without admixture with crude rubber or synthetic rubber. Establishments primarily engaged in the assembly and wholesale sale of scrap rubber are classified in trade industries.

Reclaimed rubber (reworked by  
manufacturing processes)

EXHIBIT D-8  
DEFINITION OF THE RUBBER  
AND PLASTICS HOSE AND  
BELTING INDUSTRY, SIC 3041

SIC 3041 RUBBER AND PLASTICS HOSE AND BELTING

Establishments primarily engaged in manufacturing rubber and plastics hose and belting, including garden hose. Establishments primarily engaged in manufacturing rubber tubing are classified in Industry 3069; plastic tubing in Industry 3079; and flexible metallic hose in Industry 3599.

Air brake and air line hose, rubber or  
rubberized fabric  
Automobile hose, plastics  
Automobile hose, rubber  
Belting: conveyor, elevator, trans-  
mission, etc. - rubber  
Fire hose, rubber  
Garden hose, plastics  
Garden hose, rubber

Heater hose, plastics  
Heater hose, rubber  
Hose: cotton fabric, rubber lined  
Pneumatic hose: air brake, air line,  
etc. - rubber or rubberized fabric  
Vacuum cleaner hose, plastic  
Vacuum cleaner hose, rubber  
V-belts, rubber or plastic

EXHIBIT D-9 (1)  
DEFINITION OF SIC 3069

SIC 3069 FABRICATED RUBBER PRODUCTS, NOT ELSEWHERE CLASSIFIED

Establishments primarily engaged in manufacturing industrial and mechanical rubber goods, rubberized fabrics and vulcanized rubber clothing and miscellaneous rubber specialties and sundries. Establishments primarily engaged in rebuilding and retreading tires are classified in Industry 7534; and gaskets and packing in Industry 3293.

Acid bottles, rubber	Culture cups, rubber
Air supported rubber structures	Cyclo rubbers, natural
Aprons, vulcanized rubber and rubberized fabric: mitse	Dress shields, vulcanized rubber and rubberized fabric: mitse
Bags, rubber or rubberized fabric	Druggists' sundries, rubber
Balloons, advertising and toy: rubber	Erasers: rubber or rubber and abrasive combined
Balloons, metal foil laminated with rubber	Fabrics, rubberized
Balls, rubber: except baseballs, basketballs, footballs, golf and tennis	Finger cots, rubber
Bath sprays, rubber	Flooring, rubber: tile or sheet
Bathing caps and suits, rubber	Foam rubber
Battery boxes, jars, and parts: hard rubber	Fountain syringes, rubber
Bibs, vulcanized rubber and rubberized fabric: mitse	Friction tape, rubber
Bottles, rubber	Fuel tanks, collapsible: rubberized fabric
Boxes, hard rubber	Funnels, rubber
Brake lining, rubber	Gloves: surgeons', electricians', household, etc. -- rubber
Brushes, rubber	Grips and handles, rubber
Bulbs for medicine droppers, syringes, atomizers, sprays: rubber	Grommets, rubber
Bushings, rubber	Gutta percha compounds
Capes, vulcanized rubber and rubberized fabric: mitse	Hair curlers, rubber
Caps, rubber	Hairpins, rubber
Castings, rubber	Handles, rubber
Chlorinated rubbers, natural	Hard rubber products
Cloaks, vulcanized rubber and rubberized fabric: mitse	Hard surface floor coverings: rubber
Clothing, vulcanized rubber and rubberized fabric: mitse	Heels, boot and shoe: rubber, composition, and fiber
Combs, hard rubber	Jar rings, rubber
	Laboratory sundries: cases, covers, funnels, cups, bottles, etc. -- rubber
	Latex, foamed
	Life jackets: inflatable, rubberized fabric

# EXHIBIT D-9 (2)

Life rafts, rubber	Rug backing compounds, latex
Liner strips, rubber	Separators, battery: rubber
Mallets, rubber	Sheeting, rubber or rubberized fabric
Mats and matting: bath, door, etc. - rubber	Sheets, hard rubber
Mattress protectors, rubber	Sleeves, pump: rubber
Mattresses, pneumatic: fabric coated with rubber	Soles, boot and shoe: rubber composition and fiber
Medical sundries, rubber	Soling strips, boot and shoe: rubber, composition, and fiber
Mittens, rubber	Spatulas, rubber
Molded rubber products	Sponge rubber and sponge rubber products
Mouthpieces for pipes, cigarette holders, etc. - rubber	Stair treads, rubber
Nipples, rubber	Stationers' sundries, rubber
Orthopedic sundries, molded rubber	Stoppers, rubber
Pacifiers, rubber	Teething rings, rubber
Pads, kneeling: rubber	Thermometer cases, rubber
Pants, baby: vulcanized rubber and rubberized fabric - mitse	Thread, rubber: except fabric covered
Pillows, sponge rubber	Tile, rubber
Pipestems and bits, tobacco: hard rubber	- Top lift sheets, rubber
Platens, except printers: solid or covered rubber	Top roll covering, for textile mill machinery: rubber
Plumbers' rubber goods	Toys, rubber
Pontoons, rubber	Trays, rubber
Pump sleeves, rubber	Tubing, rubber
Rods, hard rubber	Type, rubber
Rolls, except printers: solid or covered rubber	Urinals, rubber
Rubber bands	Valves, hard rubber
Rubber covered motor mounting rings (rubber bonded)	Wainscoting, rubber
Rubber heels, soles, and soling strips	Washers, rubber
	Water bottles, rubber
	Weather strip, sponge rubber
	Wet suits, rubber
